

# PowerEdge R7515

Report produced January, 2021

From design to end-of-life and everything in between, we work to improve the environmental impact of the products you purchase. As part of that process, we estimate the specific impacts throughout the lifecycle. This includes the contributions from materials, manufacturing, distribution, use and end-of-life management.

This product's estimated carbon footprint:

**8990** kgCO<sub>2</sub>e \*

Estimated impact by lifecycle stage:

Dell uses PAIA (Product Attribute to Impact Algorithm) to perform product carbon footprints. PAIA is a streamlined LCA tool developed by [MIT's Materials System Laboratory](#). It takes into consideration important attributes of the product which can be correlated to activities in order to calculate the product carbon footprint.

Due to high configurability of servers, the information provided here was calculated based on the products highest selling configuration (see assumptions on page 2).

- Manufacturing
- Use
- Transportation
- EoL

# PowerEdge R7515

\* This product has an estimated standard deviation of +/- 2090 kgCO<sub>2</sub>e

As part of our commitment to transparency, the chart to the right demonstrates the degree of uncertainty that exists within the PAIA model for product carbon footprinting, based on assumptions we have made for select variables.

Assumptions for calculating product carbon footprint:

Product Weight	36.3 kg	Server Type	Rack	Assembly Location	EU
Product Lifetime	4 years	Use Location	EU	Energy Demand (Yearly TEC)	1949.5 kWh
HDD/SSD Quantity	X2 480GB 2.5" SSD	DRAM Capacity	8GB	CPU Quantity	1

8990 kgCO<sub>2</sub>e

**1 of these products...**  
has a footprint approx.  
equivalent to **driving 22,025 miles** in a passenger car.

**10 of these products...**  
have a footprint approx.  
equal to what **106 acres of US forests** can absorb in a year.

**100 of these products...**  
have a footprint about the same as the annual average carbon footprint of **178 people**.

To help our customers and other stakeholders contextualize product carbon footprint values, we provide these approximate equivalencies. Please remember these are estimates and should not be used for emission inventory or formal carbon footprinting exercises.

Calculations are based on the following methodologies: 2.45 miles driven per 1 kg co<sub>2</sub>e (source: [U.S. EPA](#)); approx. 850 kg co<sub>2</sub>e absorbed per acre of forests over a year (source: [U.S. EPA](#)); global personal carbon footprint estimated at 5 MTco<sub>2</sub>e per person (source: [World Bank](#)).

Disclaimer: This PCF was calculated using the PAIA model, version 1.2.12, 2021. Results shown here are subject to change as the tool is updated.
